Lateral Cervical Projection

Name: Bad Spine Date of Birth: 8/7/1954

X-Ray was obtained: 6/29/2013

Date of Digitization: 6/29/2013

Mr. Bad Spine's x-rays were analyzed utilizing the PostureRay® computerized X-ray digitizing system with impressions interpreted by Dr. Joe Ferrantelli. X-Ray digitization for spinal biomechanics has been shown to be valid when compared to standard hand drawn methods. The patient's findings were then compared to established normals at each level and then globally. The X-Ray mensuration method used in analyzing this patient have been studied for reliability and validity and these results are as follows:

This green curved line represents the Normal Spinal Position and expected path of the posterior longitudinal ligament.

This red line represents the patient's position and the path of the posterior longitudinal ligament.

Lateral Cervical Projection

Spinal Biomechanics Compared to Normal

Segments Analyzed	RRA Normal Values	RRA Patient Values	Difference From Normal	Segmental Translations*
C1 to Horiz.	-29.0°	-30.7°	5.9%	Tanolationo
C2-C3	-10.0°	-13.0º	30.0%	-2.0 mm
C3-C4	-8.0°	1.0º	112.5%	-0.9 mm
C4-C5	-8.0°	7.8º	197.5%	1.0 mm
C5-C6	-8.0°	14.9º	286.2%	-1.1 mm

Lateral Cervical Projection

Impressions and Assessment

The posterior tangent method of radiographic analysis has been studied extensively for both validity and reliability[1;2-5], and has been shown to be a superior method of analysis for biomechanical assessment over the Cobb method of x-ray analysis for sagittal cervical spine.[3] Using this radiographic analysis technique, the normal cervical lordosis measured from C2-C7 for a normal average population was found to measure -34° with ideal alignment measuring -42°.[1;2] (Note that the negative sign preceding the measurement of degree indicates direction, thus the normal Lordotic/extended position and an abnormal flexion angle/kyphosis is noted by a positive angle). There is a statistically significant association between cervical pain and lordosis < -20° and a "clinically normal" range for cervical lordosis of -31° to -40°.[6] Further, there is no evidence that hypertonicity as seen in muscle spasms in muscle groups responsible for anterior cervical translation and head flexion have any significant impact on cervical lordosis.[7]

As noted in this computerized analysis, Mr. Bad Spine's cervical spine measures 8.5°. According to recent research, Mr. Bad Spine's cervical spine alignment is predictive of chronic neck pain.[1] This is a loss from the expected normal lordosis by 120.2%. Regarding anterior cervical translation (weight bearing) findings of less than 15mm has been established as a normal.[1;2] Mr. Bad Spine has an abnormal anterior cervical translation from C2 relative to C7 of 17.8mm.

Disc thinning noted C6/7. Disc thinning noted C5/6. moderate to severe spondylosis is noted. No acute bony abnormalities or osseus disease.

Impressions and Assessment

The posterior tangent method of radiographic analysis has been studied extensively for both validity and reliability_[4-8], and has been shown to be a superior method of analysis for biomechanical assessment over the Cobb method of x-ray analysis for sagittal cervical spine._[6] Normal values for intersegmental motion should not exceed more than 10-11° of angular motion._[9] Using the posterior tangent method of radiographic analysis, motion that exceeds 10° has been shown to predict and discriminate minor ligamentous injuries from those patients with true whiplash type ligamentous injuries._[3] Corroborating these findings using another method of analysis (inferior endplate assessment), an alteration of motion segment integrity (AOMSI) has been defined as motion at the level in question that is more than 11° greater than at either adjacent level._[11] Regarding segmental translational movements, authors have noted that subluxation should be noted with a range of 1.0-3.0mm_[2] of intersegmental movement with absolute clinical cutoff threshold value of 3.5mm._[1:9] Of additional importance, improvement in neutral lateral cervical lordosis has been shown to be associated with significant improvement in the translational and rotational motions of the lower cervical spine. Flexion/extension kinematics are partially dependent on the posture and sagittal curve orientation._[10]

There is anterior widening of the intervertebral disc space at C2-C3, C3-C4 levels evidenced by excessive segmental extension, which indicates possible damage to the anterior longitudinal ligament and/or intervertebral disc at said level. There is possible significant damage to the posterior longitudinal ligament and/or posterior intervertebral disc and/or interspinous ligament which is indicated by an increased widening of the posterior intervertebral disc space angulation and increased separation of spinous processes at the following levels: C4-C5, C5-C6.

- Segmental flexion instability is noted at the following segments: C4-C5 of 11.9°, C5-C6 of 14.4°.
- Segmental extension instability is noted at the following segments: C2-C3 of -21.4°, C3-C4 of -11.9°.
- Segmental subluxation for flexion is noted at the following segments: C2-C3 with -1.2 mm.

Lateral Cervical Flexion/Extension

- Segmental subluxation for extension is noted at the following segments: C2-C3 with -2.9 mm, C3-C4 with -2.7 mm, C4-C5 with -1.6 mm.
- Segmental translational instability for flexion is noted at the following segments: none
- Segmental translational instability for extension is noted at the following segments: none

Flexion View Impressions: Very limited global ROM is noted with associated spinal coupling. No acute bony abnormalities or osseus disease.

Extension View Impressions: Very limited global ROM is noted with associated spinal coupling most noted mid to lower cervical spine. I suspect delayed instability will appear once more normal global ROM is achieved.

According to the above biomechanical assessment, there are findings of alteration of motion segment integrity (AOMSI) at the following levels: C2-C3, C3-C4, C4-C5 and C5-C6. Consequently, this patient may be rateable for a permanent injury upon reaching maximal medical improvement.

AP Cervical Projection

Name: Bad Spine Date of Birth: 8/7/1954

X-Ray was obtained: 6/29/2013

Date of Digitization: 6/29/2013

Mr. Bad Spine's x-rays were analyzed utilizing the PostureRay® computerized X-ray digitizing system with impressions interpreted by Dr. Joe Ferrantelli. X-Ray digitization for spinal biomechanics has been shown to be valid when compared to standard hand drawn methods. The patient's findings were then compared to established normals at each level and then globally. The X-Ray mensuration method used in analyzing this patient have been studied for reliability and validity and these results are as follows:

Spinal Biomechanics Compared to Normal

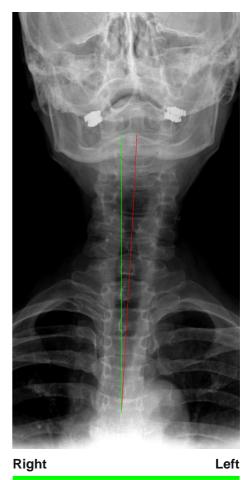

Global Analysis	Normal Values	Patient Values	Difference From Normal
RZA T5	0°	-3.3º	3.3º
CDA C2-T5	0°	0.8º	0.8º
Translation C2-T5	0 mm	9.8 mm	9.8 mm

CDA = Cervico-dorsal Angle and is a measure of the mid cervical angle RZA = Rotation Angle relative to true vertical of the lower cervical and upper thoracic spine

Impressions and Assessment

The x-ray analysis performed on this AP cervico-thoracic view has been studied for reliability and demonstrated both intraexaminaer and interexaminer reliability.[1] As noted above in the table, Mr. Bad Spine's cervical spine is translated (listed) from plumb by 9.8 mm to the left. Of importance is that the patient has a mid neck abnormal angle of 0.8 degrees to the right. The patient has an angular displacement from normal (plumb) of the lower cervical and upper thoracic spine of 3.3 degrees to the left.

No acute bony abnormalities or osseus disease. Mild to moderate diffuse degenerative changes noted.

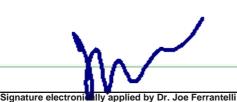

This green line represents normal spinal position.

This red line represents the patient's alignment and the projected centers of mass of the spine.

Global Analysis	Normal Values	Patient Values	Diff. From Normal
CDA C2-T7 (C7 apex)	0°	6.6°	6.6°
Left C1-C2 "overhang"	0 mm	1.2 mm	1.2 mm
Right C1-C2 "overhang"	0 mm	1.7 mm	1.7 mm
C2 Spinous Rotation	0°	1.1º	1.1º
Upper Angle	0°	0.7º left (89.3º)	0.7°
Lower Angle	0°	6.1º right (83.9º)	6.1º
Translation	0 mm	14.6 mm	14.6 mm

CDA = Cervico-dorsal Angle and is a measure of the mid cervical angle

Impressions and Assessment

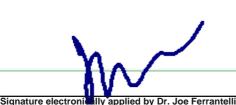

As noted in the table, Mr. Bad Spine has a 1.2 mm left shift of C1 relative to the lateral body margin of C2 on the left side. On the patient's right side, there is a 1.7 mm left shift of C1 relative to the lateral body margin of C2. Concerning the angular findings of atlas relative to the skull, Mr. Bad Spine's spine denotes an upper angle measurement of 0.7 degrees to the left and a lower angle of 6.1 degrees to the right. Ideal alignment in this region of the upper cervical region is should approximate 0 degrees of offset of the upper angle and lower angle - meaning the skull sits perpendicular to the Atlas bone. The spine is translated (listed) from plumb by 14.6 mm to the left. Of importance, is that the paient has a mid neck cervico-dorsal angle of 6.6 degrees to the right.

No acute bony abnormalities or osseus disease. Dens and C1 appear unremarkable for bony abnormalities.

The red line represents the patient's alignment and the projected centers of mass of the spine.

Consequently a "-" negative sign preceding a measured value indicates posterior translation for linear movements; and a "-" preceding angular measurements indicate relative segmental or global extension rotational movement.

Values derived from sectional view for higher level of validity

Impressions and Assessment

The x-ray mensuration analysis used in this analysis has been studied and shown to be superior and more valid to methods such as Centroid and Cobb analysis of the thoracic kyphosis.[1] The normal thoracic kyphosis has an established elliptical shape with an overall normal angulation measuring 44° T1-T12. 42° T2-T11, and 37° T3-T10.[2] As noted above in the table, Mr. Bad Spine's thoracic kyphosis is decreased 41.4% compared to normal. The patient has a forward thoracic translation from T1 relative to T12 of 49.0 mm. There is an overall hypokyphosis noted in the thoracic spine.

No acute bony abnormalities or osseus disease. Mild diffuse degenerative changes are noted.

Anterior

Posterior

This green curve represents the Normal Spinal Position and expected path of the posterior longitudinal ligament.

This red line represents the patient's position and the path of the posterior longitudinal ligament.

Date of Digitization: 6/29/2013

Mr. Bad Spine's x-rays were analyzed utilizing the PostureRay® computerized X-ray digitizing system with impressions interpreted by Dr. Joe Ferrantelli. X-Ray digitization for spinal biomechanics has been shown to be valid when compared to standard hand drawn methods. The patient's findings were then compared to established normals at each level and then globally. The X-Ray mensuration method used in analyzing this patient have been studied for reliability and validity and these results are as follows:

Spinal Biomechanics Compared to Normal

Segments Analyzed	RRA Normal Values	RRA Patient Values	Difference From Normal	Segmental Translations*
T112-L1	-1°	-12.2º	1120.0%	-0.2 mm
L1-L2	-5°	-8.6º	72.0%	-1.2 mm
L2-L3	-6º	-11.7º	95.0%	-1.6 mm

Anterior

Posterior

This green line represents the Normal Spinal Position and expected path of the posterior longitudinal ligament.

This red line represents the patient's position and the path of the posterior longitudinal ligament.

Lateral Lumbar Projection

Impressions and Assessment

The x-ray mensuration utilized in this assessment has been studied and noted to have high inter- and intra-examiner reliability_[1] and also to be preferred method of analysis when compared to Cobb and Centroid, and Trall analysis especially when the angle of lordosis is to be measured._[2] Normal lordosis for the lumbar spine has been demonstrated and for individuals with normal morphology, it has been found that those with a hyperlordosis were associated with acute lumbar pain, compared to those with chronic lumbar pain demonstrating a hypolordosis. Thus altered configurations of the normal elliptical anthropometric model of the lumbar lordosis may clinically correlate with the development of degenerative changes in the spinal tissues and production of low back pain syndromes._[3]

As noted above in the table, Mr. Bad Spine has an overall increase from normal lordosis by 52.8%. The patient has a anterior translation from T12 relative to S1 of 25.9 mm.

This red line represents the patient's alignment and the projected centers of mass of the spine. R-F: Risser-Ferguson Method of analysis Cobb: Cobb Method of analysis

AP Lumbar Scoliosis Projection

Spinal Biomechanics Compared to Normal

Global Analysis	Normal Values	Patient Values	Difference From Normal
Risser-Ferguson Angle T11-L3 (L1)	0.0°	20.7°	20.7º
Cobb Angle T11-L3	0.0°	42.9°	42.9°
Translation at Apex T11-L3 (L1)	0.0 mm	10.6 mm	10.6 mm
Translation T11-L3	0.0 mm	-1.9 mm	1.9 mm
Translation T11-S1	0.0 mm	30.9 mm	30.9 mm
HB Angle	0.0°	-8.1º	8.1º

HB Angle = the angle formed by a line across the sacral base relative to horizontal.

Direction of measured displacements are indicated using the right-hand Cartesian coordinate system method in biomechanics. Consequently a "-" negative sign preceding a measured value indicates left translation for linear movements; and a "-" preceding angular measurements indicate relative segmental or global rotational movement to the left.

Mr. Bad Spine has a 1 curve scoliosis at T11-L3 with the apex on the left at L1. Using the Risser-Ferguson method of analysis, Mr. Bad Spine's scoliosis measures 20.7 degrees (moderate), and using the Cobb method of analysis measures 42.9 degrees (severe).

Transitional lumbar segment noted with sacralization. No acute bony abnormalities or osseus disease.

AP Modified Ferguson View Base Sacral

Name: Bad Spine Date of Birth: 8/7/1954

X-Ray was obtained: 6/29/2013

Date of Digitization: 6/29/2013

Mr. Bad Spine's x-rays were analyzed utilizing the PostureRay® computerized X-ray digitizing system with impressions interpreted by Dr. Joe Ferrantelli. X-Ray digitization for spinal biomechanics has been shown to be valid when compared to standard hand drawn methods. The patient's findings were then compared to established normals at each level and then globally. The X-Ray mensuration method used in analyzing this patient have been studied for reliability and validity and these results are as follows:

Spinal Biomechanics Compared to Normal

Global Analysis	Normal Values	Patient Values	Difference From Normal
Femur Unleveling*	0 mm	right 2.8 mm	2.8 mm
Sacral Base Unleveling*	0 mm	left 10.5 mm	10.5 mm
Pubic Symphysis to S2	0 mm	right -3.0 mm	3.0 mm
HB Angle	0°	-3.4º	3.4º
LS Angle T12-L5 (L2 apex)	90°	-89.1º	0.9º
LD Angle T12-L5	0°	8.4º	8.4º
Translation T12-S1	0 mm	5.6 mm	5.6 mm

* Accounting for magnification

HB Angle = the angle formed by a line across the sacral base relative to horizontal. LS Angle = Lumbo-sacral angle

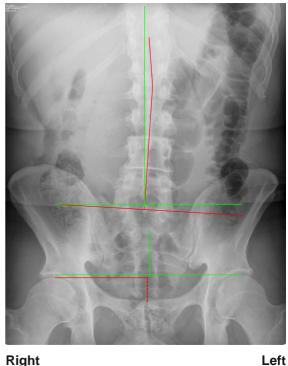

LD Angle = Lumbar-Dorsal angle

Impressions and Assessment

As noted above in the table, the left side of the sacrum is deficient by 14.1mm accounting for magnification, it measures 10.5mm. The Femur offset is 3.7mm short on the right side which approximates 2.8mm, when accounting for magnification. As for the Pubic Symphysis offset to S2, it measures -3.0mm to the right.

There are sufficient visible vertebrae to measure that Mr. Bad Spine's upper lumbar spine is translated (listed) from plumb by 5.6 mm to the left. The patient has a mid lumbar curve of 8.4 degrees. The patient's sacral base is offset and inferior on the left.

This is an exam with a 12mm lift on the left - full orthotic.

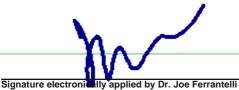

Right

This green line represents normal spinal position.

This red line represents the patient's alignment and the projected centers of mass of the spine.

Summary Impression

Name: Bad Spine Date of Birth: 8/7/1954 X-Ray was obtained: 6/29/2013

Date of Digitization: 6/29/2013

Clinical correlation is made with the x-ray analysis at the following subluxated segments: C5/6/7 as well as mid thoracic spine and distal lumbar spine. Most notably the patient's history of compaints of cervicothoracic pain, headaches, cervical radiculopathy, and lumbar pain. Overall, the x-ray analysis findings do correlate with our clinical findings. This is causing neurological damage to the patient's spinal cord and instability to the osseous structures of their vertebral column. Left untreated this condition will worsen causing permanent aberrant spinal biomechanical and neurological degenerative changes in the spine.

I also ssuspect we may need correlation to MRI should no steady progress be achieved.

The patient's scoliosis can be stabilized with coneservative methods and SpiineCor bracing, as the patient has already consulted a surgeon, and at this time does not wish to undergo surgical intervention. Left untreated this condition will worsen causing permanent aberrant spinal biomechanical and neurological degenerative changes in the spine.
